HTML Classes and <div> Element

The <div> element is a block-level container used to group HTML elements and apply CSS styling or JavaScript.

The class attribute assigns a class name to an element. Classes are reusable and used to apply CSS styles to multiple elements.

Example:

```
<div class="container">
<h2 class="title">Welcome</h2>
<p class="description">This is a styled paragraph.</p>
</div>
```

CSS Example:

```
<style>
.container {
padding: 20px;
background-color: #f0f0f0;
}
.title {
color: blue;
}
.description {
font-size: 14px;
}
```

```
</style>
```

You can also apply multiple classes to an element:

```
<p class="info highlight">Important note</p>
```
